### REC\_DS using C\_Week 2\_COD\_Question 5

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Ashwin is tasked with developing a simple application to manage a list of items in a shop inventory using a doubly linked list. Each item in the inventory has a unique identification number. The application should allow users to perform the following operations:

Create a List of Items: Initialize the inventory with a given number of items. Each item will be assigned a unique number provided by the user and insert the elements at end of the list.

Delete an Item: Remove an item from the inventory at a specific position.

Display the Inventory: Show the list of items before and after deletion.

If the position provided for deletion is invalid (e.g., out of range), it should

display an error message.

### ***Input Format***

The first line contains an integer  $n$ , representing the number of items to be initially entered into the inventory.

The second line contains  $n$  integers, each representing the unique identification number of an item separated by spaces.

The third line contains an integer  $p$ , representing the position of the item to be deleted from the inventory.

### ***Output Format***

The first line of output prints "Data entered in the list:" followed by the data values of each node in the doubly linked list before deletion.

If  $p$  is an invalid position, the output prints "Invalid position. Try again."

If  $p$  is a valid position, the output prints "After deletion the new list:" followed by the data values of each node in the doubly linked list after deletion.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

1 2 3 4

5

Output: Data entered in the list:

node 1 : 1

node 2 : 2

node 3 : 3

node 4 : 4

Invalid position. Try again.

### ***Answer***

```
// You are using GCC
```

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```

typedef struct node{
    int v;
    struct node* next;
}node;
void insert(node** head,int v){
    node* nn=(node*)malloc(sizeof(node));
    nn->v=v;
    nn->next=NULL;
    if(*head==NULL){
        *head=nn;
        return;
    }
    node* temp=*head;
    while(temp->next!=NULL){
        temp=temp->next;
    }
    temp->next=nn;
}
void print(node* head,int m){
    node* temp=head;
    for(int i=1; i<=m && temp!=NULL; i++){
        printf("node %d : ",i);
        printf("%d\n",temp->v);
        temp=temp->next;
    }
}

void deleteatpos(node* head,int p,int m){
    node* temp=head;
    node* next;
    printf("After deletion the new list:\n");
    int i=1;
    while(i<p-1){
        temp=temp->next;
        i++;
    }
    next=temp->next;
    temp->next=next->next;
    free(next);
    print(head,m-1);
}
int main(){

```

```
int n,v;
scanf("%d",&n);
node* head=NULL;
for(int i=0; i<n; i++){
    scanf("%d",&v);
    insert(&head,v);
}
int p;
scanf("%d",&p);
printf("Data entered in the list:\n");
print(head,n);
if(p>n){
    printf("Invalid position. Try again.\n");
    return 0;
}
deleteatpos(head,p,n);
return 0;
}
```

**Status :** Correct

**Marks :** 10/10
